What is Legionnaires' disease?

Legionnaires' disease, a severe form of pneumonia, is caused by breathing in droplets of water containing *Legionella*. Symptoms usually occur within 2 weeks following exposure and include:

- Cough
- Shortness of breath
- Fever
- Muscle aches
- Headaches

Who is at increased risk?

In most cases, healthy people exposed to *Legionella* do not get sick. The following people are at an increased risk of getting sick:

- People 50 years or older (especially current or former smokers)
- People with a chronic lung disease
- People with weak immune systems
- People with underlying illnesses such as diabetes, cancer, or kidney failure

What should I do if I think I have Legionnaire's Disease?

If you develop symptoms and may have been exposed to *Legionella*, see a doctor right away. Legionnaires' disease is treated with antibiotics (drugs that kill bacteria in the body). Most people who get sick need care in a hospital but make a full recovery.

Legionnaires' Disease and Your Household Water

Legionella is a type of bacteria found naturally in freshwater environments, like lakes and streams. It can become a health concern when it grows and spreads in human-made building water systems.

Where does *Legionella* grow and spread?

Legionella can grow in many parts of a water system that are continually wet, and certain devices can then spread droplets of water containing the bacteria. Examples of areas where Legionella can grow and spread include: water storage tanks, water filters, faucets, aerators, showerheads, hoses, pipes, hot tubs, and humidifiers.

What factors or conditions can lead to the growth or spread of *Legionella* in my household water?

- Temperature of hot water tank is set too low
- Infrequently used showers or sinks
- Build-up of sediment (dirt) in hot water tank
- Not following manufacturer's instructions for maintenance and replacement of water filters and other devices

Best Practices for Preventing the Growth of Legionella

- Let your faucets and showers run for at least 3 minutes when they have been out of use for more than a week.
- Thoroughly clean or replace your shower heads and faucet aerators (screens) 3-4 times per year.
- Drain and flush your hot water tank every 6-12 months. Consider hiring a licensed plumbing professional to perform this.
- Clean and/or replace all water filters per manufacturer's instructions, such as whole house (e.g., water softeners) and point-of-use filters (e.g., built-in refrigerator filters).
- Remove, shorten, and/or regularly flush existing dead legs (a section of pipe with low use). For future renovations, ensure your plumber avoids creating dead legs.
- Avoid high-risk activities. If you are at an increased risk for Legionnaires' disease, consider avoiding power washing, or similar activities, which may generate increased amounts of aerosols or mist.

- Medical devices and portable humidifiers should be operated,
 cleaned, and disinfected per manufacturer's instructions. Do not use tap
 water if sterile water is required.
- Keep your hot water tank set to a minimum of 120°F. This temperature will reduce Legionella growth and minimize risk of hot water burns. Although setting the tank up to 140°F is best for controlling Legionella, especially if atrisk individuals are in your home, if the temperature is set to greater than 120°F a mixing valve must be installed to prevent hot water burns when using the water. Be sure to check with manufacturer recommendations prior to raising the temperature.
- Drain garden hoses and shut off the water line when not in use for the season.
- Maintain chemical levels in your hot tub per manufacturer's recommendations.

Home air-conditioning units are not at risk for *Legionella* growth because they do not use water to cool the air.
